

Data Management in Public Transport

The continuous digitalization of the railway industry underscores the need for enhanced data handling and management. We support our clients with smart data management solutions, so that their processes run efficiently and reliably – without media disruptions.

We advise infrastructure operators and railway companies on which data is required, when it needs to be made available and how it should be kept up to date. We work with them to develop processes for efficient and secure data processing and administration.

Our services include:

- Requirements engineering
- Definition of processes and tools
- Supporting the procurement, expansion or development of suitable software
- Integration of IT solutions and development of interfaces to peripheral systems (e.g., ERP systems)
- Definition of appropriate criteria to ensure optimal data quality
