

Systems consulting

Complex IT solutions often present a big challenge for executives and project managers. We help you to deal with strategic questions and processes of digital transformation in terms of requirements analyses, defining goals, concept development and implementation.

Our systems consulting focuses equally on private industry and the public sector (e-government). We often rely on the interdisciplinary approach of systems engineering and its problem-solving cycle. This creates a sound basis for optimal, objective decisions.

We offer you:

- Strategy consulting: We work with your organization to develop a vision, strategic goals, guiding principles and steps for their implementation.
- Organizational consulting and process consulting: We analyze business processes and organizational structures regarding their weaknesses, examine the IT and physical resources being deployed and determine the requirements for achieving optimal operational solutions.
- Needs-based data acquisition: We use our many years of experience with data acquisition methods and data processing methods to support your organization as you collect, analyze and monitor key performance indicators.
- E-government consulting: We have sound knowledge of e-government, citizen engagement and crowdsourcing as well as open data and open government data (OGD). We support your organization as you design corresponding workflows and organizational structures, gather and utilize user-generated content and open up datasets.
