

Carbon Footprint

Carbon footprint is an essential tool to calculate greenhouse gas emissions of companies, products, services or events. A carbon footprint serves as a basis for developing climate protection strategies. We help you to calculate emissions, to define goals and options for action or to induce efficiency measures.

Carbon Footprint

- A carbon footprint**
- ... provides information about greenhouse gas emissions of products, companies, services or events and facilitates the comparison of different products, activities or measures.
 - ... serves as a basis to generate CO₂ emission reduction certificates, for example in CDM projects or projects for the Climate Cent Foundation.
 - ... serves as a basis for climate protection strategies, efficiency measures and the related financial savings.
 - ... provides well-communicable results.
 - ... helps achieving a higher profitability.

- Our services**
- Determining goals, system boundaries and appropriate methodologies for greenhouse gas reduction (carbon dioxide or all greenhouse gases of the Kyoto Protocol)
 - Collecting data and calculating emissions
 - Identifying possible courses of action, measures and recommendations.
 - Support for implementation of measures, monitoring and reporting.
