

Electromobility in the Region of Basel: Measures Concept

EBP identifies and analyses possible measures that would help create favourable conditions for the successful provision of appropriate charging infrastructure by private individuals, business leaders, power suppliers and, if necessary, the federal government.

For years various stakeholders have followed the development of electromobility in the region of Basel with great interest. Indeed, the region of Basel offers excellent conditions for the development of electromobility and has taken on the role of a pioneer in Switzerland.

The aim of the present study is to identify and analyse measures that can be implemented to encourage the development of an appropriate charging infrastructure by private individuals, companies, power suppliers and, if necessary, the federal government. The major features of the study include an analysis of the practicability of charging infrastructure in public spaces (e.g. special traffic zones) and provision of information and recommendations early-on for homeowners in houses and apartments as well as business stakeholders (e.g. employers and the operators of parking garages, shopping centres and leisure centres). Various approaches to the use of federal funds to promote the development of electromobility are also examined.
