

Water supply

Water supplies are increasingly confronted with demographic changes, changes in usage behavior, ageing of infrastructure, higher expectations in terms of water quality, and water scarcity. We are committed to supplying populations, both in Switzerland and abroad, with safe drinking water. We also provide support during the planning, project development and implementation processes, as well as for maintaining the full range of installations, from the water intake all the way to the house connection.

Our services encompass the following topic areas:

- General water supply projects (GWSP), water supply planning for emergency situations
- Feasibility studies, project planning, tenders and construction supervision for drinking water supply installations
- Process engineering for drinking water treatment and operational optimization
- Reduction of water losses
- Hydraulic network calculations and operational optimization
- Value retention and investment planning
- Water management in catchment areas
- Risk management and quality assurance
- Fees and tariff models
- Business development and financial planning
