

Environmental reporting and monitoring

As a developer, do you ask yourself which environmental regulations apply to your project or if you even need to conduct an environmental impact assessment (EIA)? Are you looking for someone to guide you through this process who can deal with both environmental agencies and other environmental organizations? Do you need a partner who is also familiar with environmental problems on construction sites within the context of on-site environmental monitoring? Then you have come to the right place!

You as a developer are faced with a wide range of environmental regulations at federal, canton and local level during the planning and implementation stages. The competent authorities hold you responsible for compliance with all of these regulations. For larger-scale projects, compliance is usually based on an environmental impact assessment report, while smaller projects use what is known as an environmental impact statement. And sometimes it is not clear whether an EIA is required. In these kinds of cases, the appropriate form of environmental reporting must be established in cooperation with the developers and the environmental agencies.

Our services:

- Clarification of whether an EIA is required and the likelihood of project approval at an early stage
- Drafting of environmental impact assessment report and environmental impact statements
- Defining and planning of environmental protection measures
- Consultation with the developers during the approval process
- Environmental monitoring and supervision of soil protection measures at construction sites
- Formal environmental sign-off and evaluation of success
- Public relations and, if necessary, involvement of environmental organizations entitled to raise objections
